Characterizing Dust Emission Hotspots

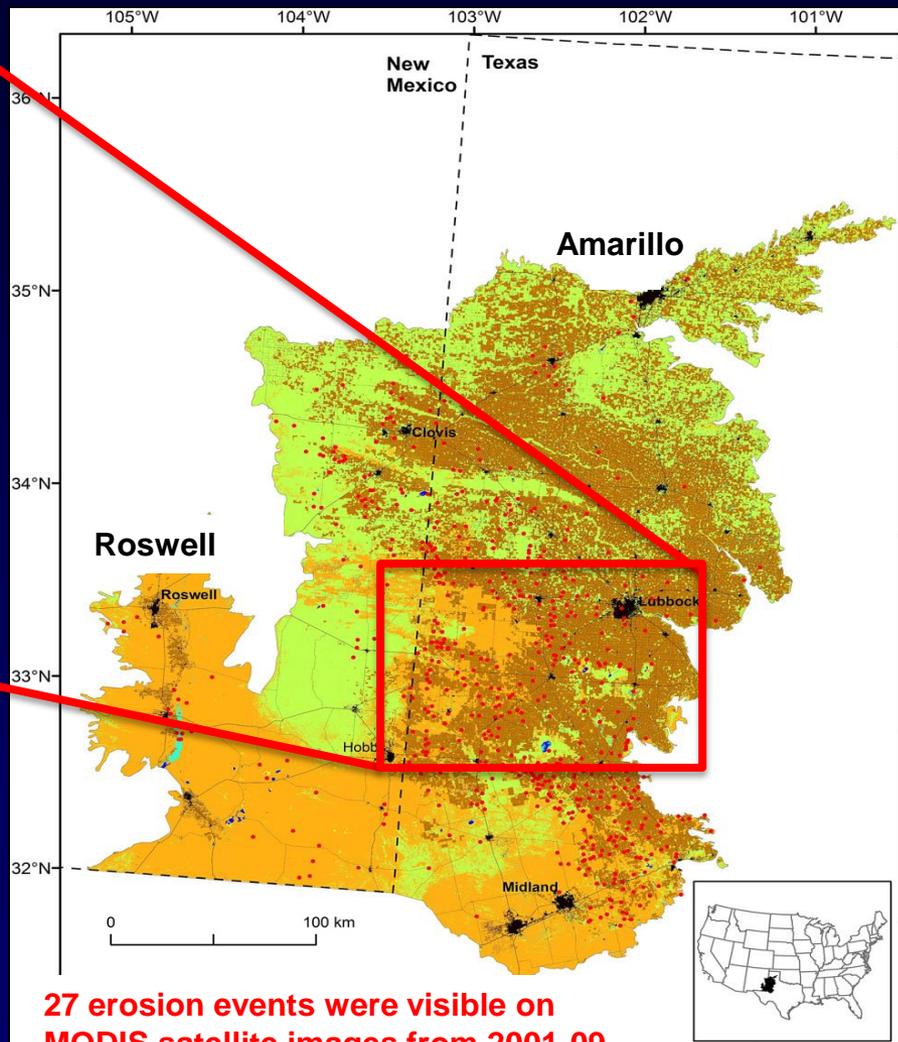

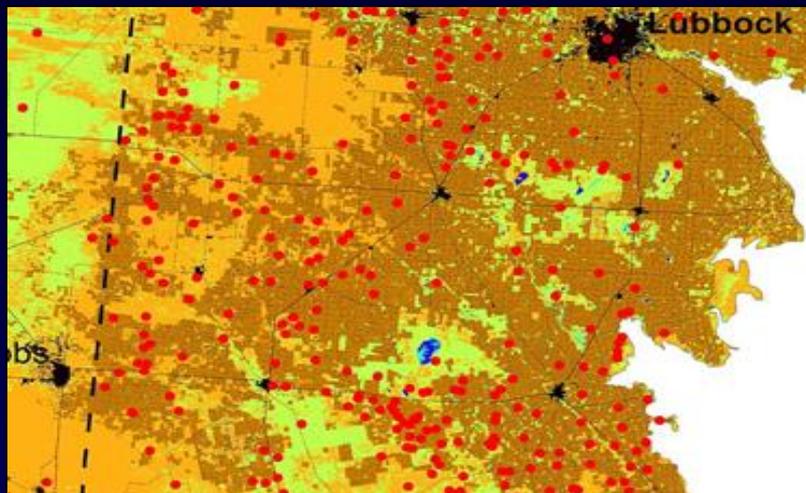

Characterizing Dust Emission Hotspots

Lee et al. 2012

Characterizing Dust Emission Hotspots

Land cover class	Area (%)	Dust hotspots
Shrubland	31.8	104
Grassland	30.7	126
Cropland	32.7	359
Other	4.8	36

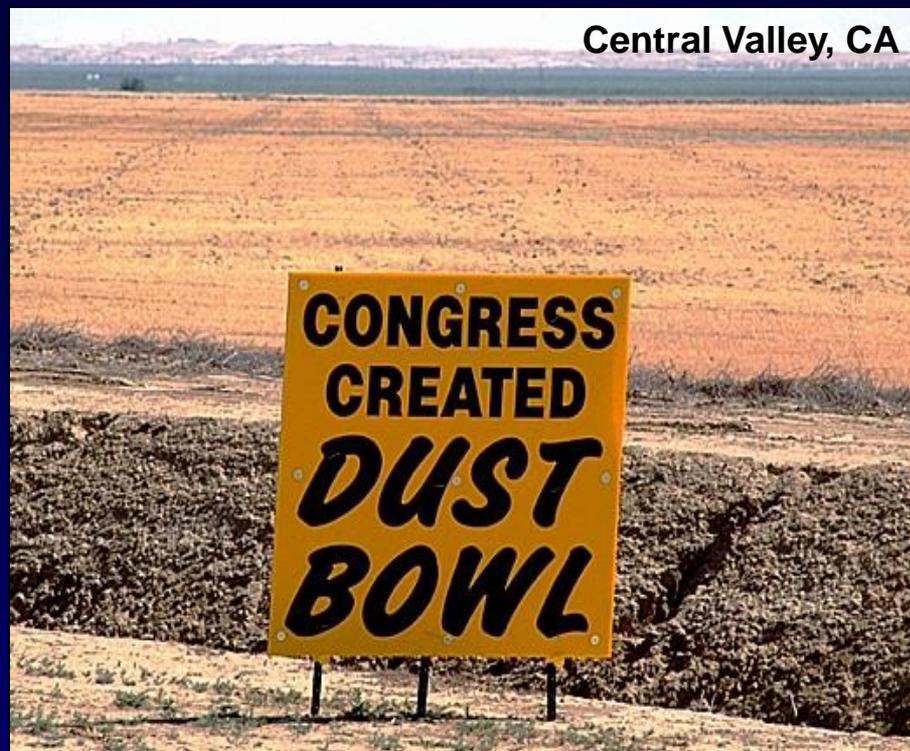

27 erosion events were visible on MODIS satellite images from 2001-09. 625 point sources were located.

Lee et al. 2012

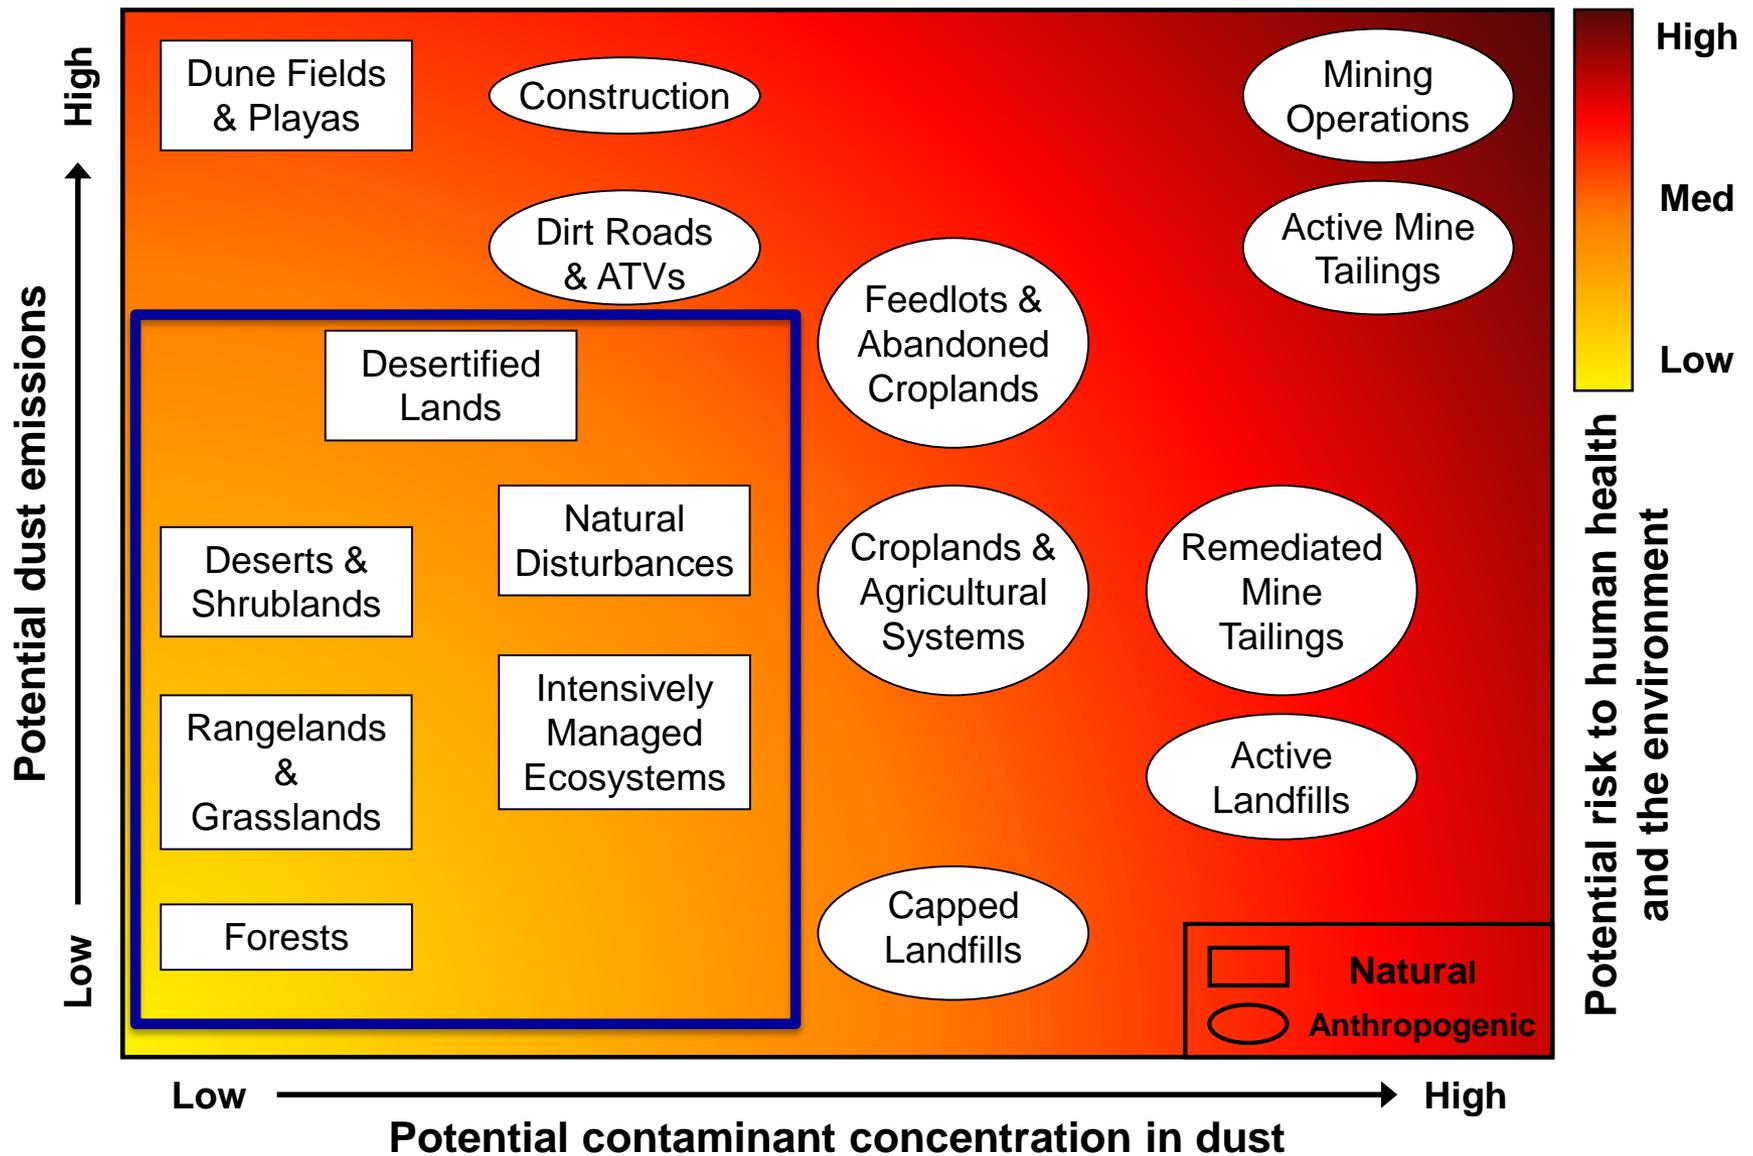

Characterizing Dust Emission Hotspots

Most probable locations and conditions for dust emission hotspots (from Gillette 1999):

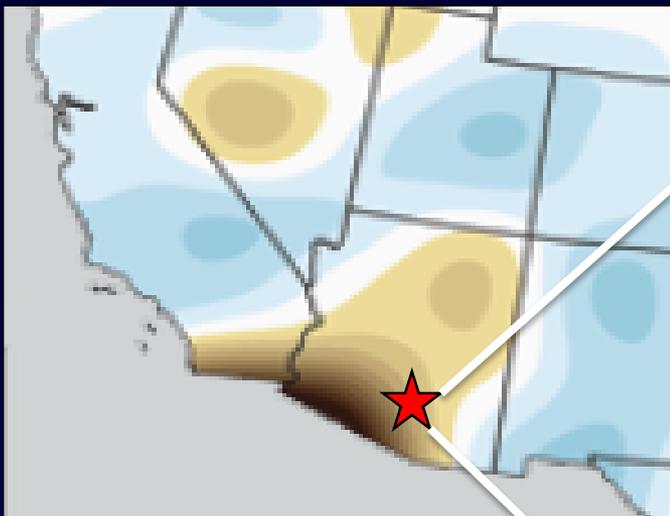

1. Unvegetated and free of gravel
2. Sandy sediments
3. Long fetch length
4. Smooth surface roughness (z_0)
5. Disturbed sediment
6. Lacking soil moisture/aggregates
7. Thick sediment deposits
8. Strong meso-scale winds
9. Topographically-forced wind convergence

Natural and Anthropogenic Sources of Dust

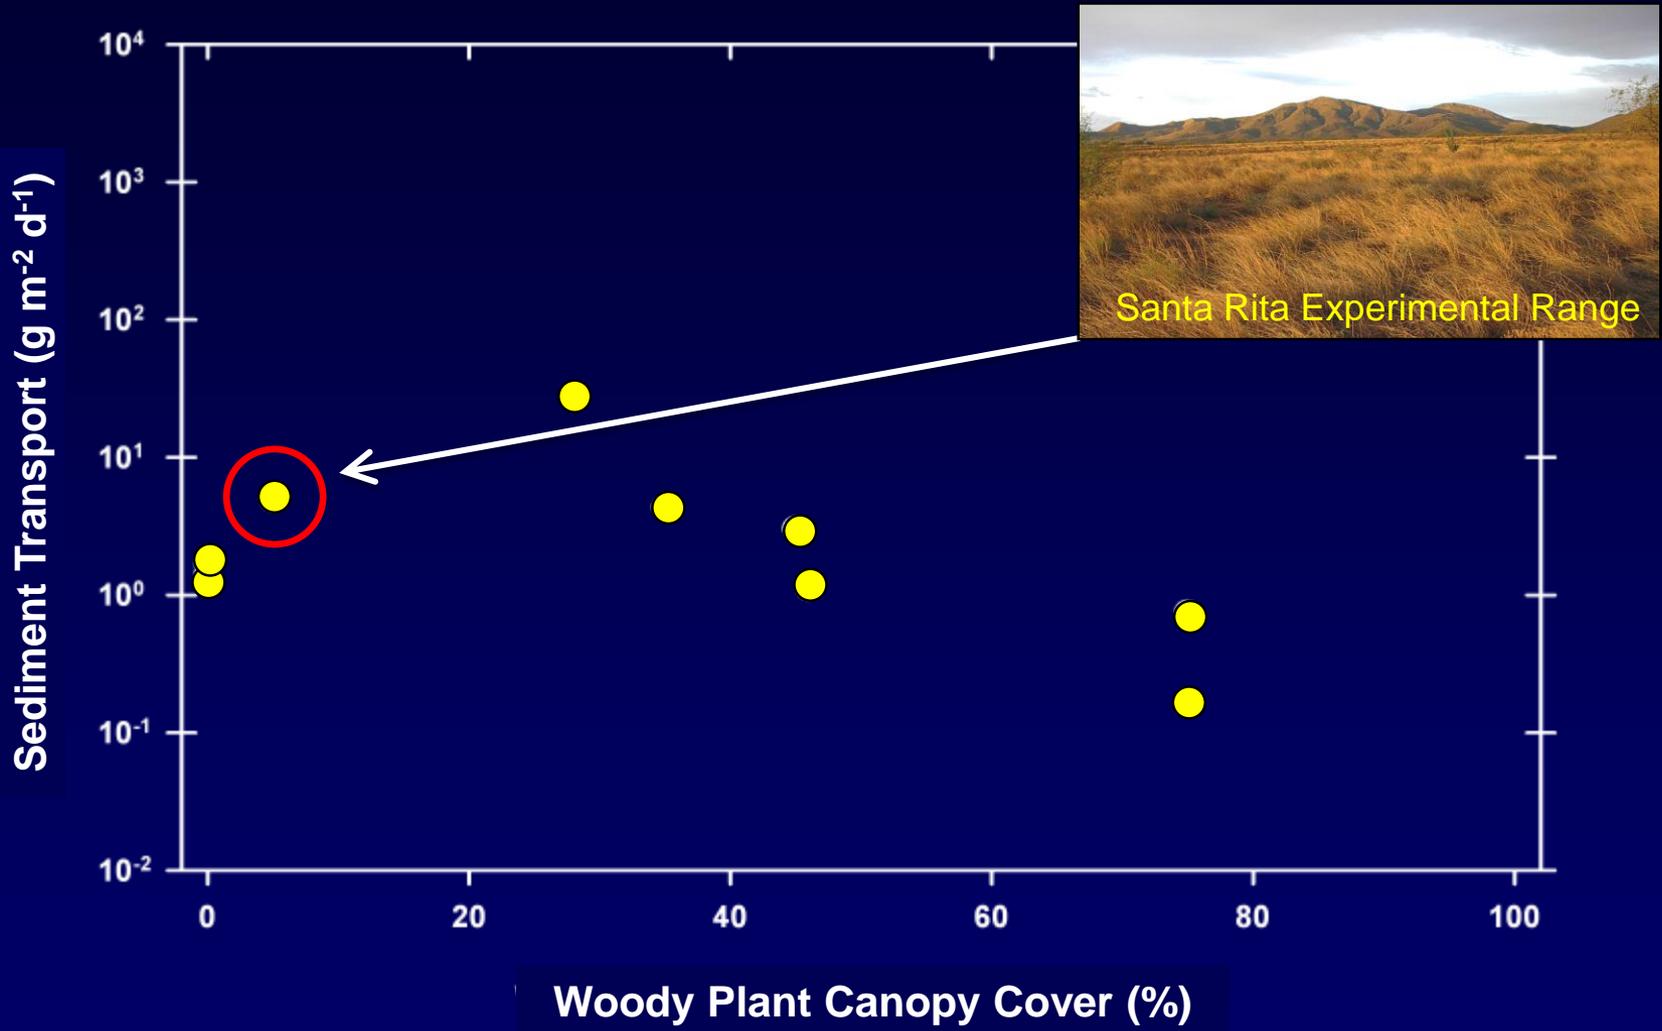

Dust Emission Hotspots: Land Use and Climate

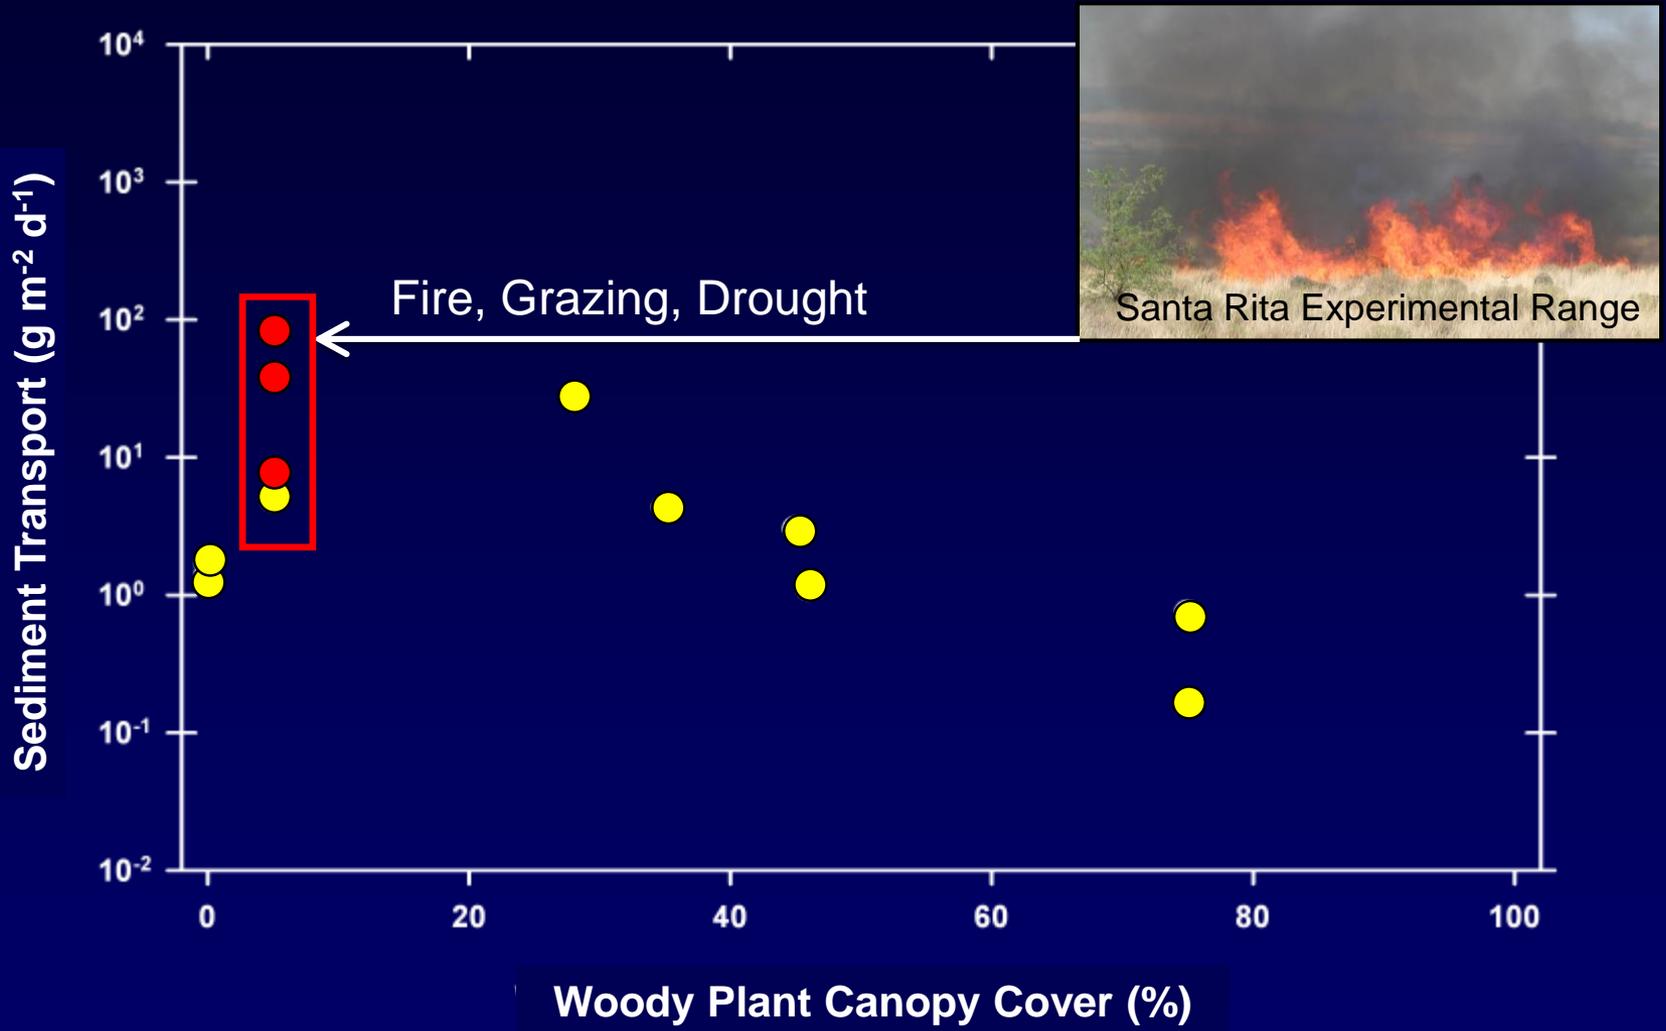

- Study site: **Santa Rita Experimental Range, AZ**
- Annual precipitation: **350 mm**

Natural and Anthropogenic Sources of Dust

Iron King Superfund Site at Dewey-Humboldt, Arizona

Seeds

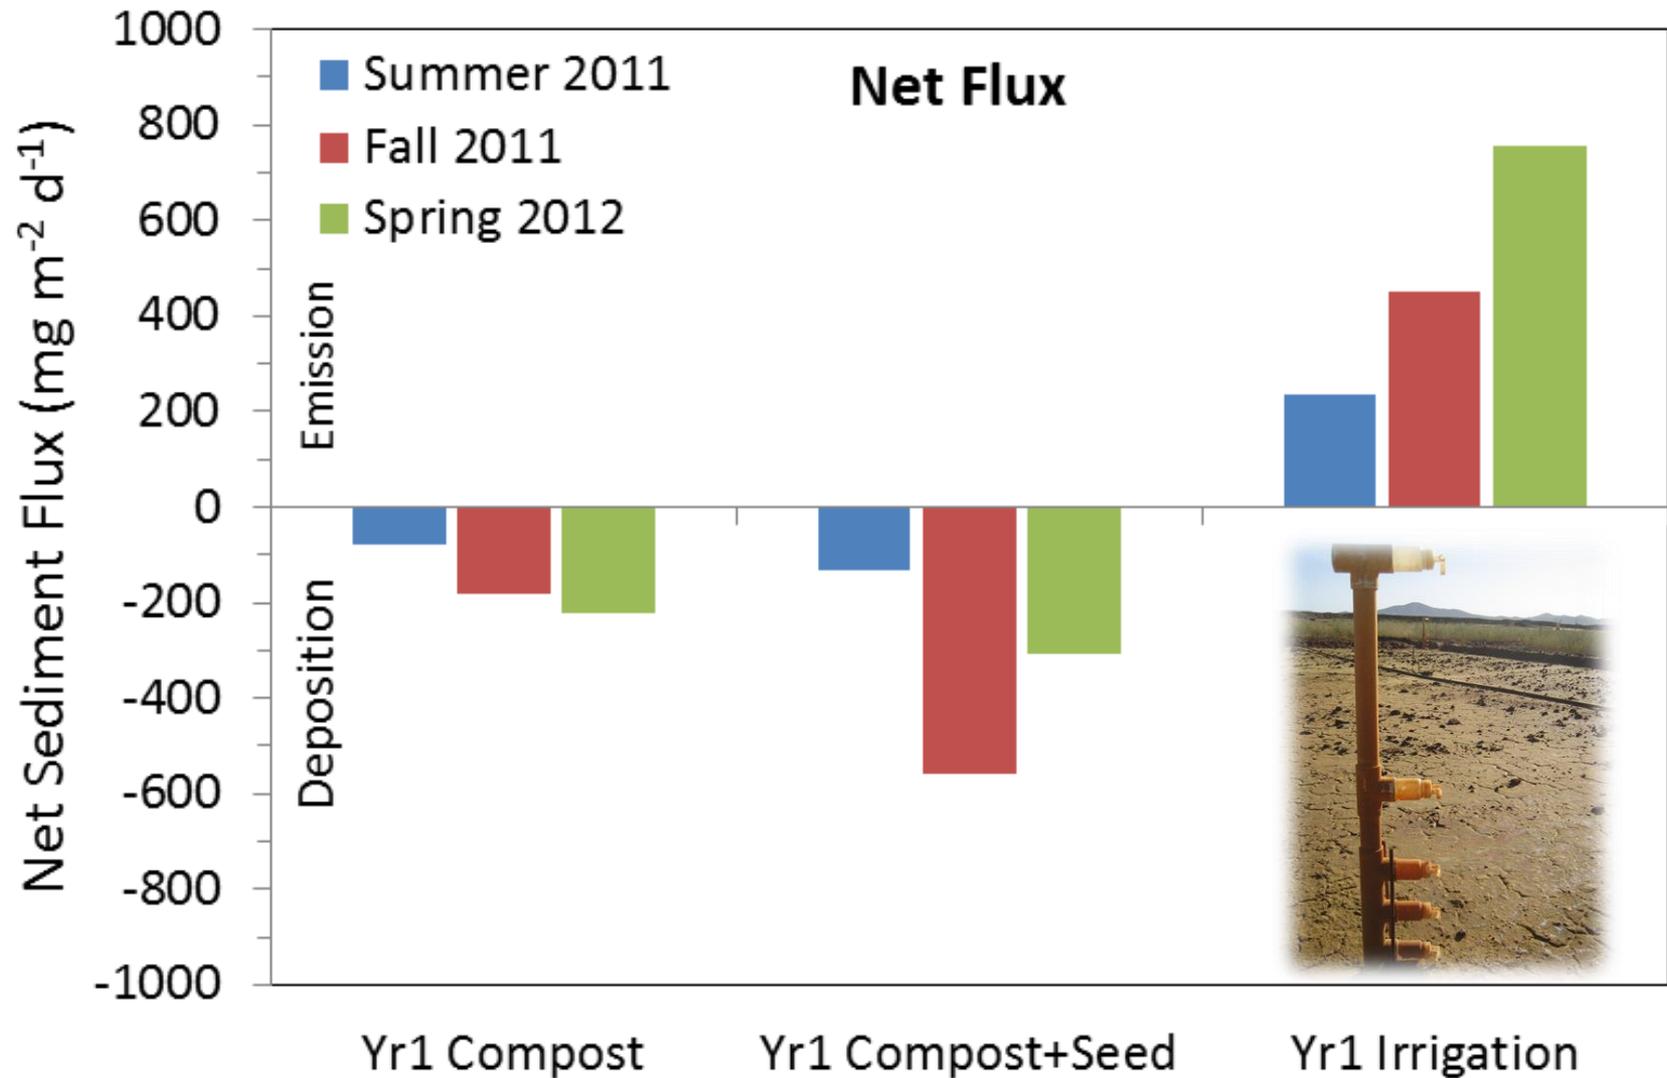

- Buffalo grass (BG)
- Arizona fescue (AF)
- Quailbush (QB)
- Mountain mahogany (MM)
- Mesquite (MQ)
- Catclaw acacia (AC)

Treatments

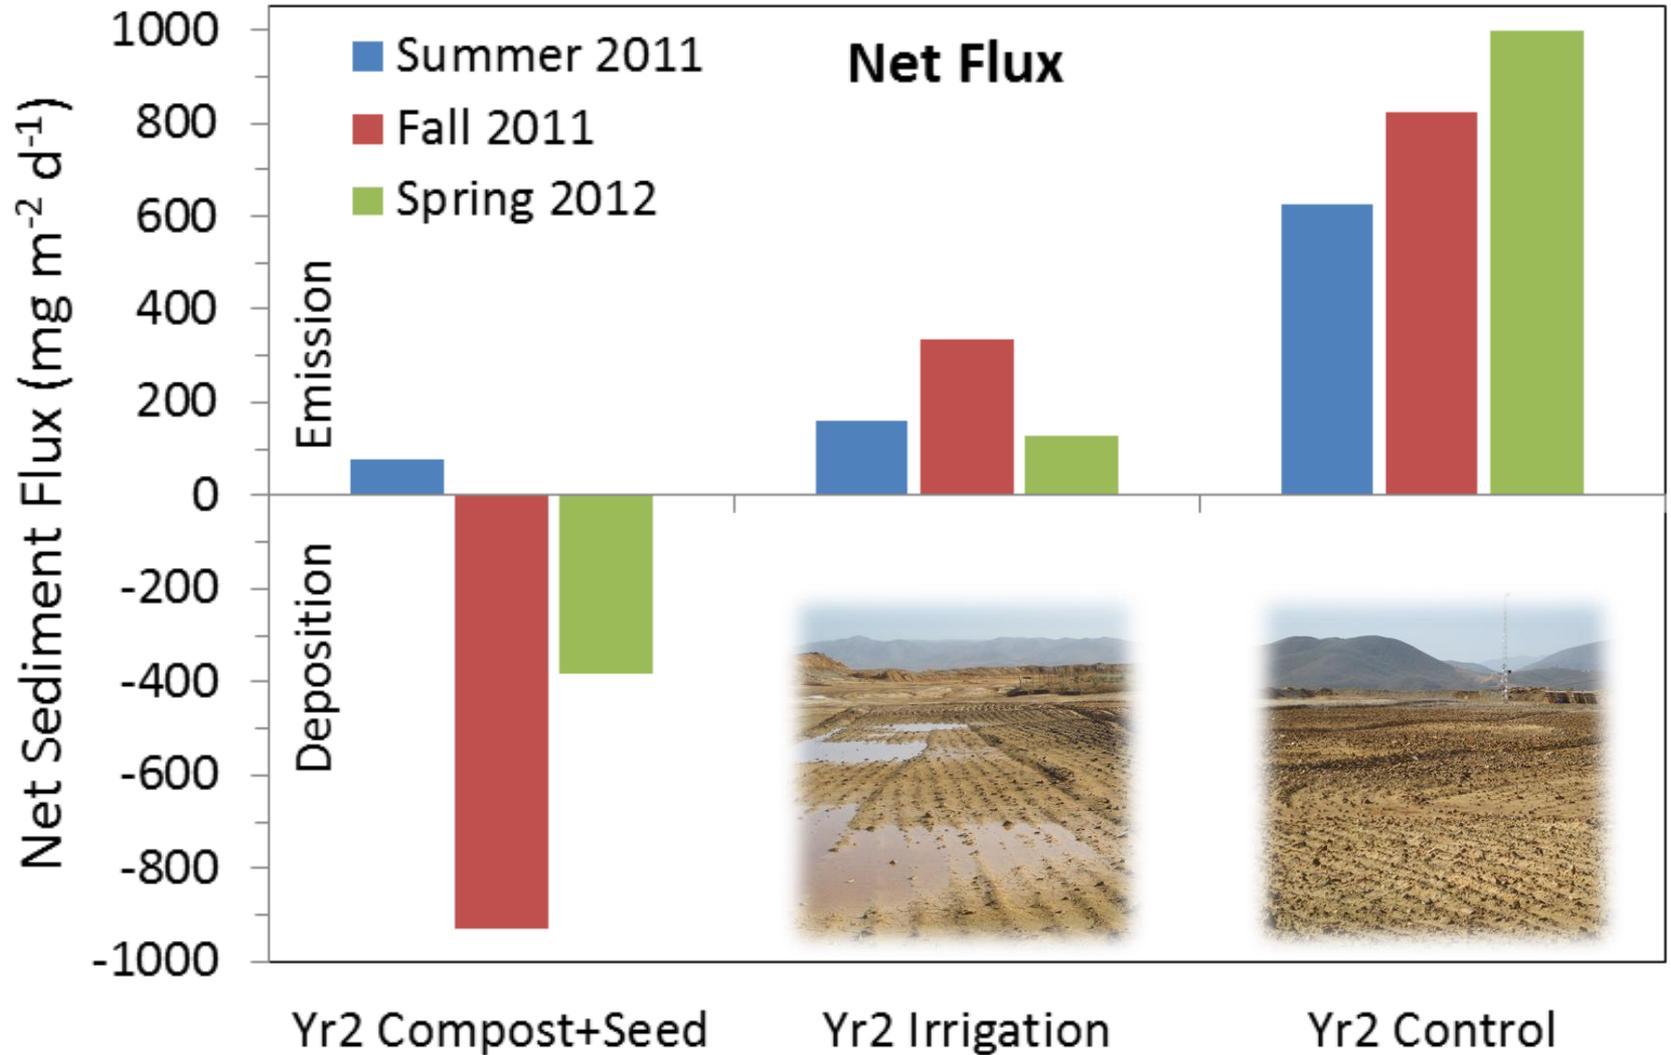

- 1 15% Compost + Seeds
- 2 15% Compost + No seeds
- 3 20% Compost + Seeds
- 4 20% Compost + No seeds
- 5 10% Compost + BG & MQ
- 6 Unamended Control

Natural and Anthropogenic Sources of Dust

Dust Emission Hot Spots: Playas

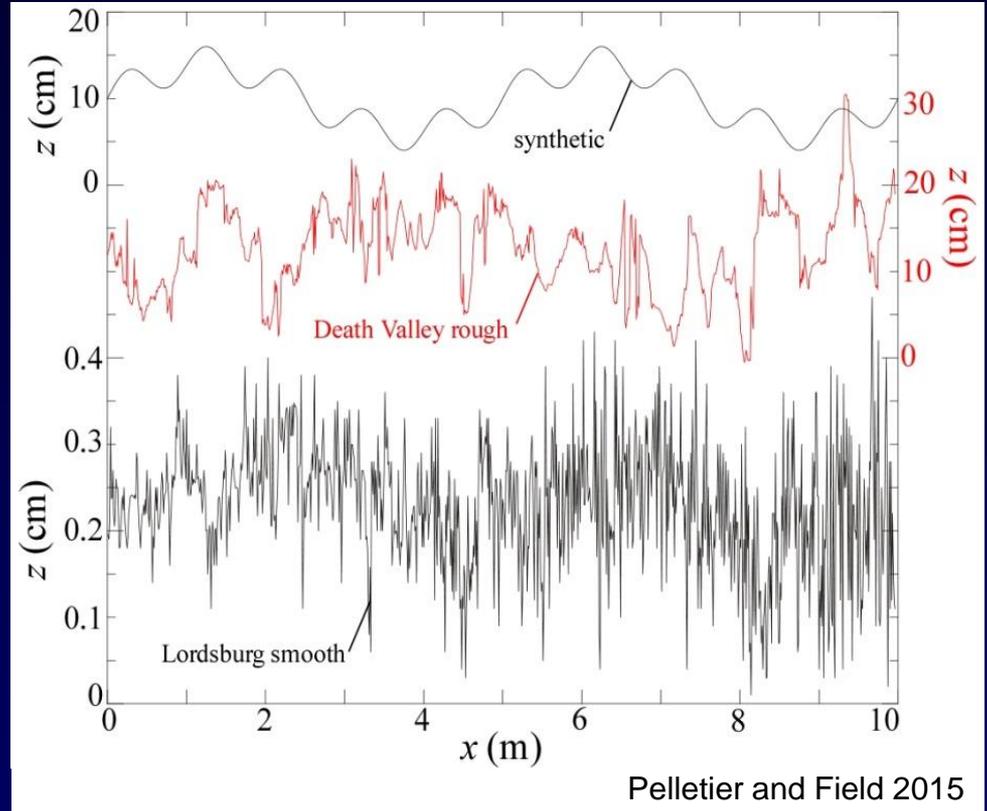

Dust Emission Hot Spots: Playas

Law of the Wall

$$u(z) = \frac{u_*}{\kappa} \ln\left(\frac{z}{z_0}\right)$$

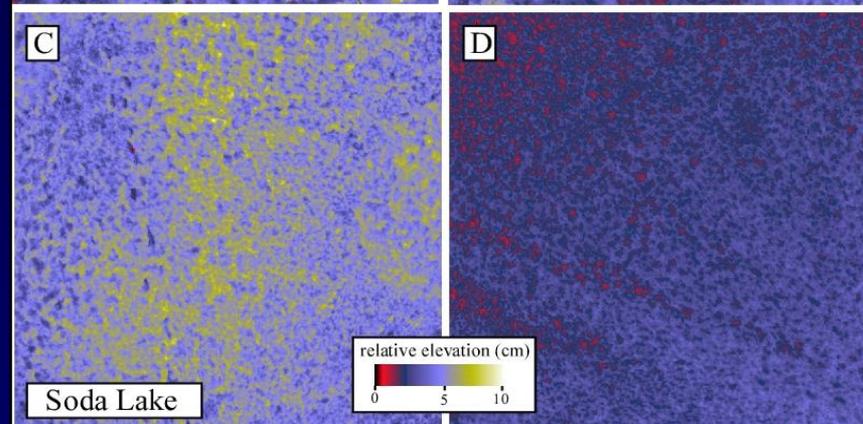

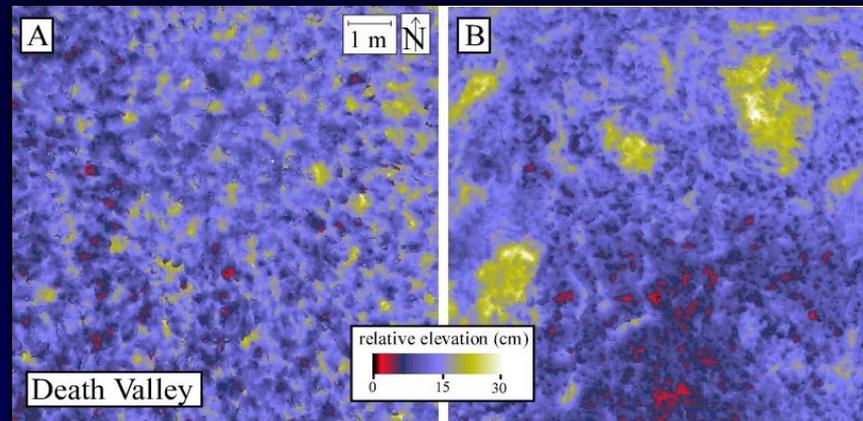

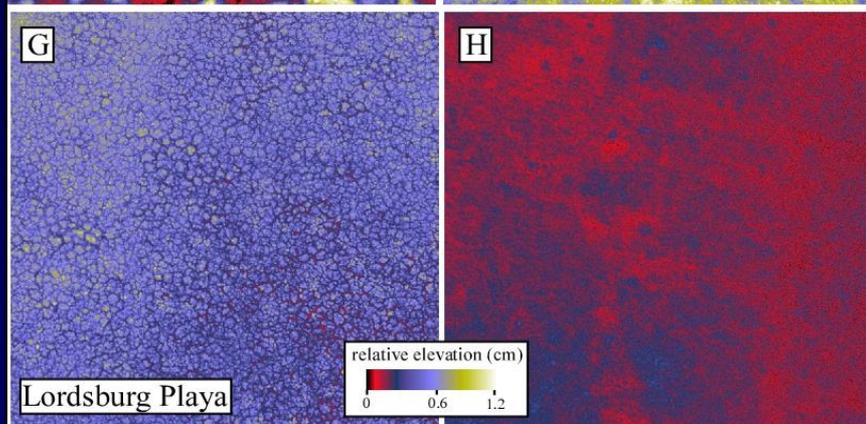

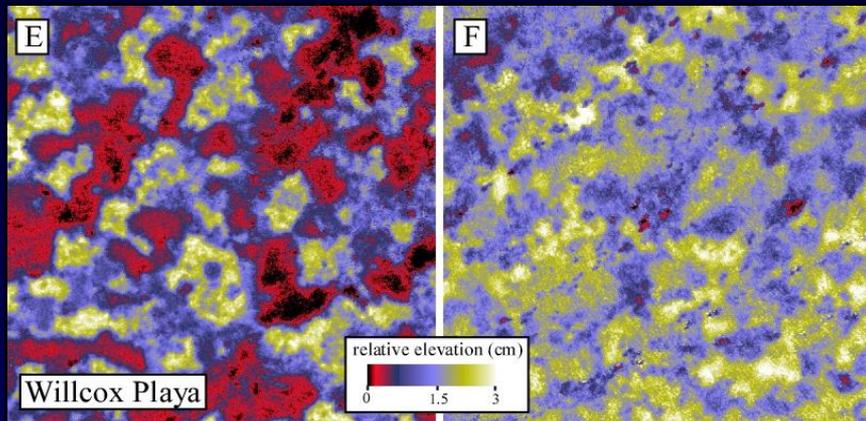

$u(z)$ = fluid velocity at height z above the bed

u_* = shear velocity

κ = von Kármán constant (0.41)

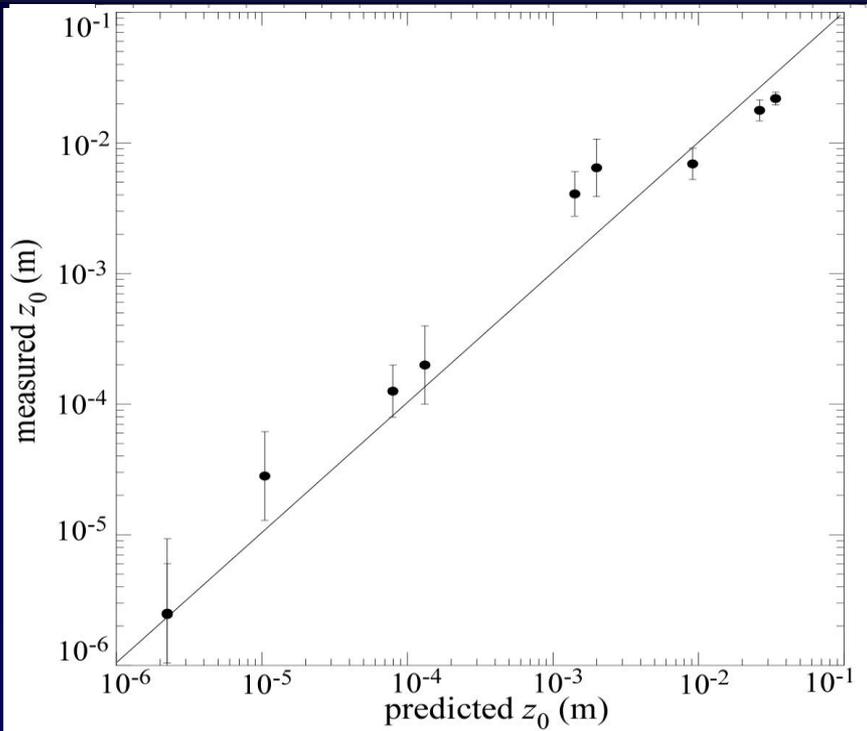

z_0 = roughness length

Dust Emission Hot Spots: Playas

Predicting Sediment Transport: Dust Models

Measured z_0 values vs. predicted

Law of the Wall

$$u(z) = \frac{u_*}{\kappa} \ln\left(\frac{z}{z_0}\right)$$

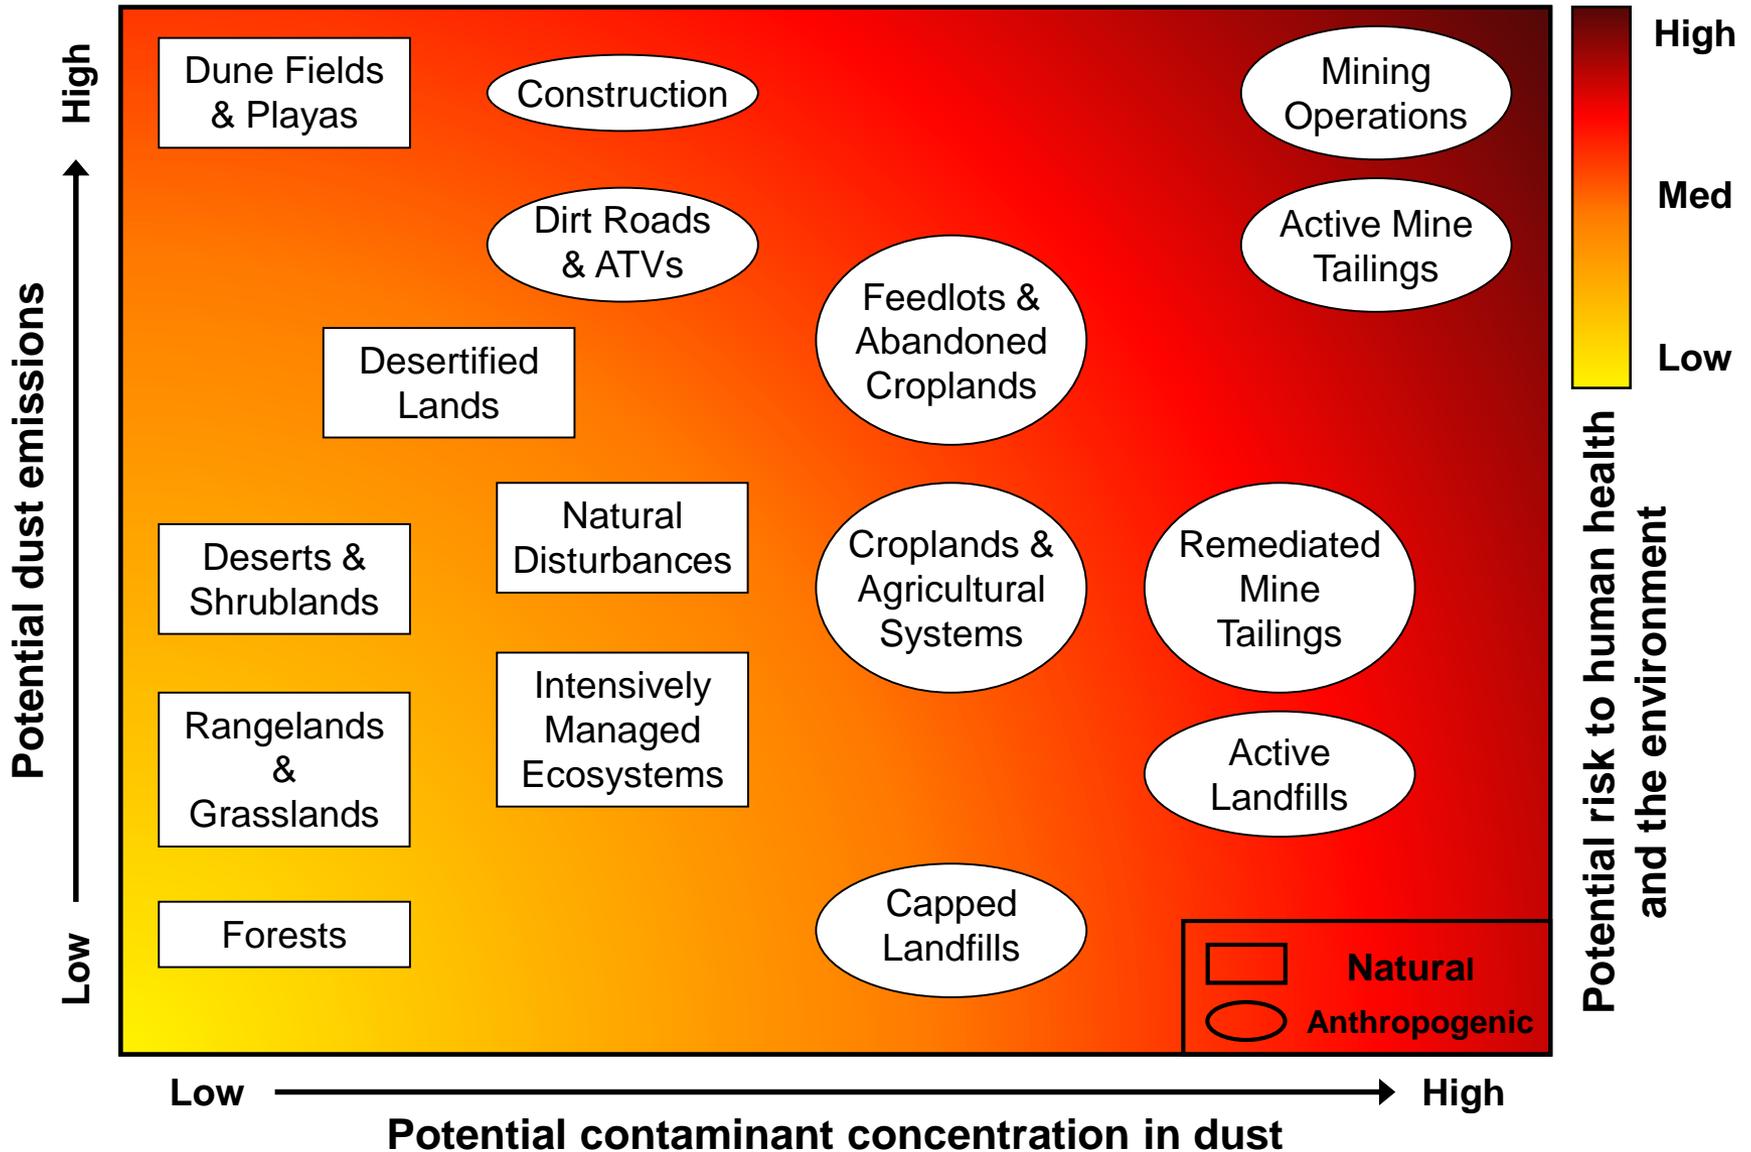

New equation for predicting **Roughness Length (z_0)** over multi-scale topography

$$z_0 = z_{0g} + \frac{c_1 a}{1 + (c_2/S)^{c_3}}$$
